

Link-Belt® Cylindrical Roller Bearings

These bearings require minimum space and provide maximum rated capacity.

Series M1000, 1200, 1300, 1900, 5200, 5300, 7300 Cylindrical Roller Bearings

Metric series cylindrical roller bearings are manufactured to ABMA boundary dimensions. These bearings require minimum space and provide

maximum rated capacity. Various configurations including separable inner or outer ring combinations offer ample application flexibility.

1. Rings of high quality bearing steel for strength, toughness and durability.
2. Microfinished raceways assure smooth operations.
3. Exclusive honed crown on roller profile for optimized raceway contact area and high capacity.
4. Structural design segmented retainer provides high strength, positive roller spacing and guidance.
5. One-piece formed steel retainer provides positive roller spacing and controlled roller guidance.
6. Polymeric retainer of glass fiber reinforced nylon 6/6 provides full roller guidance, superior lubrication and reduced noise.

Segmented Retainers

Rigid structural design segmented steel retainer provides high strength, positive roller spacing and guidance.

All contact surfaces are contoured to minimize the wiping action between retainer segments and rollers, assuring full roller lubrication. Precision spacer segments contact the rollers above and below pitch diameter resulting in low friction loss and positive roller control.

Polymeric Retainers

Made of glass fiber reinforced nylon 6/6, molded polymeric retainers provide close control of roller "drop," low noise, full roller guidance and superior lubrication, at a competitive price.

Extensive testing has established compatibility with a broad range of standard lubricants and satisfactory operation at sustained temperatures to 275°F.

Formed Steel Retainers

One-piece deep coined formed steel retainer combines strength with positive roller spacing and roller guidance.

The retainer guides the rollers below the pitch line and provides control of roller drop. Line contact of rollers on guidance surfaces minimizes wiping action and promotes hydrodynamic lubrication.

Optional Series and Configurations

Series M cylindrical roller bearings are available in seven series with segmented retainers, five series with formed steel retainers, several series with polymeric retainers, and five series of the full roller complement type. Various configurations, including separable inner or outer ring combinations are offered.

Rollers

Exclusively crowned honed rollers provide optimized contact at the raceway. This assures efficient bearing performance under load, provides controlled stress distribution under all loads

within the design capacity and compensates for shaft deflection.

Rings

Rings are manufactured from high quality bearing steel to enhance fatigue resistance, strength, toughness and hardenability.

Bearings and ring and roller assemblies for omitted-ring applications are ABMA standard boundary plan for bore, outside

diameter, and width... standard tolerances are RBEC-1. Precision tolerances to RBEC-5 are available.

Nomenclature

Symbol	Description	M	A	1	2	05	GEA	X	CO
M	Metric series designation	—	—	—	—	—	—	—	—
A	Plain cylindrical inner ring	} Omitted if inner ring not furnished	—	—	—	—	—	—	—
R	Single rib inner ring		—	—	—	—	—	—	—
SN	Short, single rib w/inner ring side plate		—	—	—	—	—	—	—
U	Double rib inner ring	—	—	—	—	—	—	—	—
S	Metric bore size of next smaller bearing	} Omitted if inner ring not furnished	—	—	—	—	—	—	—
None	Standard capacity		—	—	—	—	—	—	—
6	High capacity series	—	—	—	—	—	—	—	—
1	Narrow width	} Omitted if inner ring not furnished	—	—	—	—	—	—	—
5	Wide width		—	—	—	—	—	—	—
7	Intermediate width		—	—	—	—	—	—	—
0	Extra light series	} Omitted if inner ring not furnished	—	—	—	—	—	—	—
2	Light series		—	—	—	—	—	—	—
3	Medium series		—	—	—	—	—	—	—
9	Extra extra light series		—	—	—	—	—	—	—
05	One-fifth of bore diameter (mm)	—	—	—	—	—	—	—	—
G	Snap ring groove in outer ring O.D.	} Omitted if outer ring not furnished	—	—	—	—	—	—	—
GG	Two snap ring grooves in outer ring O.D.		—	—	—	—	—	—	—
R	Snap ring groove in outer ring O.D. snap ring included		—	—	—	—	—	—	—
RR	Two snap ring grooves in outer ring O.D.; snap rings included		—	—	—	—	—	—	—
C	Plain cylindrical outer ring		—	—	—	—	—	—	—
D	Single rib outer ring		—	—	—	—	—	—	—
E	Double rib outer ring	—	—	—	—	—	—	—	
SN	Short single rib w/outer ring side plate	—	—	—	—	—	—	—	
T	Outer ring w/two retaining rings in I.D.	—	—	—	—	—	—	—	
U	Single rib outer ring, one retaining ring in I.D.	—	—	—	—	—	—	—	
A	Oversize O.D. outer ring	—	—	—	—	—	—	—	
H	Blind dowel hole in outer ring O.D.	—	—	—	—	—	—	—	
X	Segmented retainer	} Omitted if outer ring not furnished	—	—	—	—	—	—	—
M	Full complement (no retainer)		—	—	—	—	—	—	—
V	Formed steel retainer		—	—	—	—	—	—	—
B	Polymeric retainer		—	—	—	—	—	—	—
Wxxx	This suffix specifies special bearing features	—	—	—	—	—	—	—	
None	Standard commercial clearance	} Omitted if outer ring not furnished	—	—	—	—	—	—	
C2	Less than basic clearance		—	—	—	—	—	—	
C0	Basic clearance		—	—	—	—	—	—	
C3	Greater than basic clearance		—	—	—	—	—	—	
C4	Greater than C3 clearance		—	—	—	—	—	—	
C5	Greater than standard clearance (STANDARD FOR ASSEMBLY WITH "A" OUTER RING AND OMITTED IN MODEL NUMBER)		—	—	—	—	—	—	
Cxxx	Special specific clearance or range—i.e./C002 or C35-49 or C3549	—	—	—	—	—	—		

Cylindrical Roller Bearings

To select a bearing, determine the applied radial load, any applied thrust load, the desired Rating Life, and applicable operating conditions. The procedure shown here will aid in selecting a bearing to meet an L10 design life. The formulas for calculating life expectancy should be used to determine the Rating Life L10 for the bearing selected. Cylindrical roller bearings are available in various series with cylindrical bores for direct shaft mounting. Bearings in several series may fulfill the L10 life requirements. Speed limits, minimum shaft diameters, arrangement requirements and space

limitations may be determining factors in final bearing selection. The selection procedures and rating formulas shown here are in agreement with The American Bearing Manufacturers Association Standards and ANSI/ABMA STD 11. Ratings are based on fatigue life. The Rating Life L10 or fatigue life at 90% reliability is the usual basis for bearing selection. Cylindrical roller bearings are essentially radial bearings. Nevertheless those styles where integral ribs are in the proper location on inner and outer rings will also support thrust loading. In fact, most such styles do support incidental,

axial locating loads. Whenever applied thrust loading is known to exist, the guidelines given for Thrust Loads on the next page must be carefully followed. Selection and life expectancy formulas shown here are also valid for inner ring and roller assemblies and for outer ring and roller assemblies provided they are run directly on bearing quality steel shafts or housings properly hardened and ground. To assure a satisfactory bearing application, fitting practice, mounting, lubrication, sealing, static rating, housing strength, operating conditions and maintenance must be considered.

Selection

Step 1

Determine an appropriate L10 design life.

Type of service	Operating time, hours per year	Design life, years	L10 design life, hours
Light seasonal usage	500 to 750	3-5	3,000
Heavy seasonal usage	1,400 to 1,600	4-6	8,000
Industrial—8 hour shift	2,000	10	20,000
Industrial—16 hour shift	4,000	10	40,000
Industrial—continuous	8,700	10	80,000 to 100,000
Continuous—high reliability	—	—	120,000 to 300,000

Step 2

Determine a required $\left(\frac{C}{P}\right)$ from Table 1.

Step 3

Calculate the required C and select a cylindrical roller bearing.

$P = Fr$
 required $C = \left(\frac{C}{P}\right) P$ using $\left(\frac{C}{P}\right)$ from Step 2.

Select a cylindrical roller bearing of the desired type having a basic load rating C equal to or greater than the required C from the appropriate series. The life expectancy of other sizes and series of cylindrical roller bearings can be calculated. When thrust load is present, check the individual bearing thrust capacity and follow the requirements for lubrication under thrust conditions.

Step 4

Determine the permissible speed limit of the bearing through the following procedure:

Permissible speed limits are of practical value only when considered with other factors of bearing operation. Not every application functions satisfactorily at the listed speeds. Load, lubrication, and temperature factors influence the performance. Bearing operation at the listed speed limit demands excellent lubrication, moderate load, and reasonable temperature environment.

Permissible speed can be approximated from the limiting DN value, which is the product of the bearing bore in millimeters and the speed in RPM. The DN values shown below are nominal. For higher permissible speeds, consult Rexnord Bearing Division.

$$DN \text{ value} = \text{Bearing bore (mm)} \times \text{speed (RPM)}$$

Bearing series	Limit of DN Value*
Series 1900, 1000, 1200, 1300 & 7300	
with segmented or polymeric retainer	450,000
with formed steel retainer	250,000
Series 5200, 6200, and 5300	
with segmented or polymeric retainer (5200, 5300 only)	330,000
with formed steel retainer	180,000
Full complement	150,000

*These values assume oil lubrication

Selection

Symbols for formulas:

- C = basic load rating, pounds (or newtons)
- Co = static load rating, pounds (or newtons)
- Fr = radial load, pounds (or newtons)
- L10 = rating life, hours
- n = speed, revolutions per minute
- P = equivalent radial load, pounds (or newtons)

Basic Formulas

$$\left(\frac{C}{P}\right) = \left(\frac{L_{10} \times n \times 60}{1,000,000}\right)^{3/10}$$

$$L_{10} = \frac{\left(\frac{C}{P}\right)^{10/3} \times 1,000,000}{n \times 60}$$

Life Expectancy

To calculate the Rating Life L10 of any pair of selected or trial bearings:

Step 1

Determine the equivalent radial load P.

$$P = F_r$$

Step 2 Calculate the ratio of the bearing basic load rating C to the equivalent radial load.

$$\frac{C}{P}$$

Step 3

Approximate the bearing life from Table 1.

Thrust Loads

The integral guiding ribs on standard cylindrical roller bearing inner and outer rings will support limited thrust loads. In addition, special tolerances and processing can be used to substantially increase axial load capacity. In either case, excellent lubrication (preferably with an EP lubricant) and a stabilizing radial load are required. For standard bearings, the allowable thrust load is estimated as

$$TM = \frac{C_A}{3n^{0.3}}$$

- where TM Maximum allowable thrust load, pounds (or newtons)
- CA Load rating C (pounds or newtons) of the narrowest series for the given annulus (O.D. and bore) at 33 1/3 RPM and 500L10 hours.
- n Operating speed, RPM

In addition, the thrust load should be no greater than 25% of the radial load. Where application conditions exceed either of these limits, Rexnord Bearing Division should be consulted.

Life Adjustment

The Rating Life, L10, may be modified for some applications in accordance with the formula

$$L_n = a_1 a_2 a_3 L_{10}$$

- where Ln = Adjusted life for (100-n) % reliability,
- a1 = Life adjustment factor for reliability
- a2 = Life adjustment factor for material and processing
- a3 = Life adjustment factor for operating conditions.

For most normal applications, all factors will be taken as 1, and the Rating Life used as the selection basis or life estimate. In addition, as long as standard catalog bearings are used, a2 will be normally set equal to one. The factor a3 covers such things as lubrication, misalignment, and temperature. Some conditions that could yield a3 significantly different than unity include speeds less than 20000 DN or greater than 200000 DN, temperatures below -40°F (-40°C) or above 275°F (135°C), or misalignment greater than 0.0005 radians. For other possible conditions, as well as additional information on life adjustment factors, consult Rexnord Bearing Division.

Shaft Bearing Seat Diameters

Bearing bore tolerances are in accord with the system of tolerancing established by the International Standards Organization (ISO) and adopted by the American Bearing Manufacturers Association (ABMA) and the American National Standards Institute (ANSI). A system of limits and fits has been established by ISO for shafts. A portion of this system has been adopted by ABMA to provide flexibility in selecting shaft fits. Shaft fits are designated by a lower case letter and a number, such as h6. The letter indicates the location of the shaft tolerance limits with respect to the nominal bearing bore. The number indicates the size of the tolerance zone. Shaft fits recommended for various types of applications are listed in the table at right.

A graphic relationship of various shaft fits is illustrated in the figure at the left. Many factors influence the proper fit of the bearing inner ring on a shaft. The magnitude of the load and its direction with respect to bearing inner or outer rings are generally the first factors considered in shaft fit selection. The effects of other factors such as vibration, shock, temperature, speed, etc., are of secondary importance but sometimes need to be considered. Where assembly or disassembly requirements are of prime importance special shaft fits may be required. Appropriate diameter shafting is determined (as shown) from the tables below.

Class of fit and shaft diameters (inches/um)

▲ Symbol L indicates a loose or clearance fit. Symbol T indicates a tight or interference fit. The appropriate shaft diameter for any class of fit can be easily determined by applying the shaft tolerance to the nominal shaft diameter. Example: (Using basic bearing size 03 and fit class h6)

Nominal shaft diameter	= .6693	.6693	= 17.000	17.000
Shaft diameter tolerance	= +.0000	-.0004	= + 0.000	-0.010

▲ The arithmetical mean of the largest and smallest single diameter to be within tolerance shown. Allowable deviations from mean diameter per ANSI/ABMA STD 20, latest printing.

Resultant shaft diameter = .6693 .6689 = 17.000 16.989

1µm = .001 mm

■ For solid steel shafts.

● C = Basic load rating of bearing.

Housing Bearing Seat Diameters

Bearing outside diameter tolerances are in accord with the system of tolerancing established by the International Standards Organization (ISO) and adopted by the American Bearing Manufacturers Association (ABMA) and the American National Standards Institute (ANSI).

A system of limits and fits has been established by ISO for holes. A portion of this system has been adopted by ABMA to provide flexibility in selecting housing fits. Housing fits are designated by a capital letter and a number such as H7. The letter indicates the location of the housing bore tolerance limits with respect to the nominal bearing O.D. The number indicates the size of the tolerance zone.

Housing fits recommended for various types of applications are listed in the table at the right. A graphic relationship of various housing

fits is illustrated in the figure at the left. The class of fit is determined by nature of loading (oscillating, vibrating, reversing, etc.), axial movement requirements, temperature conditions, housing material and cross section of housing.

Shaft expansion increases bearing center distances and requires all but one bearing on a shaft to be movable axially in the housing. In most bearings the outer rings are subjected to stationary loads which permit a loose housing fit.

Operating temperature may affect the housing fit, as the housing may dissipate heat rapidly and not expand with the outer ring. However, the loose fit must never be greater than necessary. Excessive looseness results in less accurate shaft centering and additional ring deformation under load.

The appropriate housing bores are determined (as shown) from the tables below.

Class of fit and housing bores (inches/μm)

▲ Symbol L indicates a loose or clearance fit. Symbol T indicates a tight or interference fit. The appropriate housing bore for any class of fit can be easily determined by applying the housing tolerance to the nominal housing bore. Example: (Using basic bearing size 926 and fit class N7)

Nominal housing bore	= 7.0866	7.0866 =	180.000	180.000
Housing bore tolerance	= -.0006	-.0022 =	-.012	-.052
Resultant housing bore	= 7.0860	7.0844 =	179.988	179.948

Operation Without Inner Ring/ Outer Ring

Outer ring and roller assembly

for Series M-EX, M-EAX, M-EB, M-EAB, M-TV, M-TAV, M-UV and M-UAV

Cylindrical roller bearings with the inner ring omitted may be installed so that the rollers operate directly on the surface of the shaft.

This type of design is useful for applications where space is limited or a larger shaft is required. Surface hardness of shaft must be Rockwell C59 to C64 to achieve full bearing capacity. Where the required hardness cannot be attained, the bearing rating must be reduced accordingly. Where the shaft is case hardened, the combination of case depth and core hardness must be adequate. Consult Rexnord Bearing Division for a specific recommendation. Shaft surface should be finished to a roughness value of 13 micro-inches, RMS, maximum (.33 μm). Maximum and minimum shaft diameter values for tap fit and press fit outer rings are listed below.

Hardness factor

If operation at rated capacity is desired when cylindrical roller bearings are used with either ring omitted, the surface on which the rollers operate must have a hardness of Rockwell C59 to C64 or equivalent Brinell hardness (see chart below). If this hardness cannot be attained, the bearing C capacity must be reduced by a rating reduction factor determined from chart on facing page.

Inner ring and roller assembly

for Series MU-X, MU-B

Cylindrical roller bearings with the outer ring omitted may be installed so that the rollers operate directly on the hardened and ground surface of a bore in an alloy steel housing.

This type of design is useful for applications where space is limited and a smaller housing bore or a larger bearing and shaft are required. Housing surface hardness must be Rockwell C59 to

C64 or Brinell equivalent to achieve full bearing capacity. Where the required hardness cannot be attained, the bearing rating must be reduced accordingly. See graph for rating reduction factor. Where the housing bore is case hardened, the combination of case depth and core hardness must be adequate. Consult Rexnord Bearing Division for a specific recommendation. Housing surface should be finished to a roughness value of 13 micro-inches, A.A., maximum (.33 μm).

Maximum and minimum housing bore values for tap fit and press fit inner rings are listed on the next page.

Additional Notes

Please call 1-866-REXNORD for availability
 Dimensions "R" and "r", largest fillet radius that will clear bearing corners
 Selection Guide, see Link-Belt Cylindrical Roller Bearing Selection Guide section
 Load Ratings & Speed Limits, see Link-Belt Cylindrical Roller Bearing Load Ratings & Speed Limits section
 For shaft and housing bearing seat diameters, see Link-Belt Cylindrical Bearing Shaft & Housing Seat Diameters section

Note: Dimensions subject to change. Certified dimensions of ordered material furnished on request.

Product Features

- Fully crowned rollers
- Precision ground ribs
- Contoured roller pockets
- Rollers individually separated
- Optional full complement
- See Features & Benefits for additional info.
